Arduino Code

For Carbon Dioxide detection in air

This code communicates with the MQ135 air quality sensor with the help of the MQ135.h library. The sensor is supposed to preheat for 24 hours before taking readings. Once the code runs, it prints out the concentration of detected gases in ppm on a serial monitor and the results are displayed on an LCD screen An alarm system (LED light) is also set to glow if the CO<sub>2<\sub> values cross a threshold value of 1000ppm.

```
#include "M0135.h"
#include <Wire.h>
#include <LiquidCrystal I2C.h> //Header file for LCD
LiquidCrystal I2C lcd(0x27,16,2);//set the LCD address to x27 for a 16 chars
and 2 line display
#define led
                     9
                                             //led on pin 9
                                             //analog feed from MQ135
const int gas_pin = A0;
MQ135 gasSensor = MQ135(gas_pin);
void setup(){
 lcd.init();
                                  // initialize the lcd
                                   // consider 16 chars + 2 lines lcd
  lcd.begin(16,2);
  lcd.backlight();
                                   // illuminate to produce visible reading
  lcd.clear();
                                   // clear lcd
  lcd.setCursor(4,0);
                                   //set cursor of lcd to 1st row and 5th
column
  lcd.print("Group L");
                                 // print as a sentence on lcd
  pinMode(gas_pin,INPUT);
                            //MQ135 analog feed set for input
  pinMode(led,OUTPUT);
                             //led set for output
                             //serial comms for debugging
  Serial.begin(9600);
}
void loop(){
 float ppm = gasSensor.getPPM();
 Serial.println(ppm);
                                 // print ppm on serial monitor
 delay(1000);
   lcd.clear();
                                // clear lcd
   lcd.setCursor(0,0);
                                // set cursor of lcd to 1st row and 1st
column
   lcd.print("Air Quality: "); // print as a sentence on lcd
   lcd.print(ppm);
                               // print value of MQ135
 if(ppm>999){
                               //if co2 ppm > 1000
    digitalWrite(led,HIGH);
                               //turn on led
    lcd.setCursor(2,1);
                               // set cursor of lcd to 2nd row and 3rd
```

```
column
    lcd.print("AQ Level BAD"); //print as a sentence on lcd
    }
    else{
        digitalWrite(led,LOW); //turn off led
        lcd.setCursor(1,1); // set cursor of lcd to 2nd row and 2nd
    column
        lcd.print ("AQ Level Good"); // print as a sentence on lcd
    }
}
```

For noise disturbance detection in the environment

/* This code is meant to monitor the sound intensity using LM393 sensor connected to Arduino UNO board. //The used sensor has only a digital output. Therefore, the number of times the sensor detects a sound is summed up over a sampling time called "SAMPLE TIME". //Then the sum called "sampleBufferValue" is printed on a Serial Monitor (laptop), and visualized with the Serial Plotter. // The code allows to communicate with a LED in order to provide a visual alarm if the "sampleBufferValue" surpasses a preset Threshold "Threshold" */ // 0 means silence and 1 means noise // The OUTPUT of the sound sensor is const int OUT PIN = 12; connected to the digital pin D12 of the Arduino const int SAMPLE TIME = 10; // The sampling time in milliseconds, can be set differently if required const int Threshold = 90; // Threshold on decibel value for LED switching ON, the value has been optimized with respect to the used sampling time (900 cumulative digital counts \approx 90 dB from "Schall") unsigned long millisCurrent; // current time unsigned long millisLast = 0; //previous time unsigned long millisElapsed = 0; // difference between current time and previous time (time interval) int sampleBufferValue = 0; // initiate the sum of digital outputs over the sampling time int led = 8;// LED on pin 4 of Arduino int dB = 0; //initiate sound intensity dB value void setup() { Serial.begin(9600); //Arduino starts serial communication with baud rate 9600

```
pinMode(led,OUTPUT);
                                // the LED is connected as output for alarm
purpose
}
void loop() {
  millisCurrent = millis();
                                               //the current time is
assigned to the dedicated variable
  millisElapsed = millisCurrent - millisLast; //the elapsed time is updated
                                             //HIGH means noise
  if(digitalRead(OUT PIN) == HIGH){
  sampleBufferValue++;
                                             //increments the sum variable
by 1
 }
   if (millisElapsed > SAMPLE_TIME) {
                                           //if the elapsed time surpasses
the sampling time, print the sampleBufferValue and test threshold for alarm
   dB = 0.0666 *(sampleBufferValue) + 30.223; //linear regression to
calculate the decibel value based of the rough calibration of the sensor
response
  Serial.println(dB);
                                             // print decibel values on the
Serial Monitor
  Serial.print("dB");
                                             // print sound unit decibel
                                            // test if the threshold is
   if (sampleBufferValue > Threshold) {
surpassed
    digitalWrite(led, HIGH);
                                            //blink LED 2 ms ON and 1 ms OFF
    delay(2);
    digitalWrite(led, LOW);
    delay(1);
  }
  digitalWrite(led, LOW);
                                           // the LED is turned off to be
ready for the next sample
  sampleBufferValue = 0;
                                           // re-initialization of the
sampleBufferValue variable for the new sampling time
  millisLast = millisCurrent;
                                           // update the previous time to be
the start for the next sample
  }
}
```
