/// The load resistance on the board
#define RLOAD 10.0
/// Calibration resistance at atmospheric CO2 level
#define RZERO 65
/// Parameters for calculating ppm of CO2 from sensor resistance
#define PARA 116.6020682
#define PARB 2.769034857
</code>

```

*Rzero is the value of the resistor in the MQ-135 sensor in the presence of clean air. Where the CO₂ value is around 397.13 ppm as given below. The Rzero value varies for each individual sensor and can be found using another Arduino

```
[[amc2021:group1:extras:r0:start|code]]
```

*RLOAD meanwhile is the external resistor value that is connected to the MQ-135 sensor, which in this case is 10kΩ.

*Important parameters are for calculating CO₂ of 116.6 and 2.79 are taken from a calibration graph as seen from the

[[https://www.electronicoscaldas.com/datasheet/MQ-135_Hanwei.pdf|datasheet]]. This shows the sensitivity of the sensor varies for each gas.
