Schematics

Code & Description

```
*/There are 2 ways to wake up a system, those are called Interrupts.
*/hardware Interrupts are based on external events where signals are sent
to the GPIO.
*/Software Interrupts occur when we program the device, like through a wake
up alarm or timer.
```

```
#define uS_TO_S_FACTOR 1000000          */Equation to convert milliseconds
to Minutes
#define TIME_TO_SLEEP  10                */Determined amount of minutes at
sleep
```

```
RTC_DATA_ATTR int bootCount = 0;
```

```
*/Data has to be stored in the Real time Clock (RTC) fast memory because
the CPU memory is wiped on every boot.
*/ The amount of data has to be minimal due to size limitations : 8bit fast
memory and 8bit Slow memory.
```

```
*/Power outages and resetting the board will erase the RTC memory,
therefore its use should be limited to non essential information.
*/Therefore we decided to just Keeping data of times awoken in internal
RTC, this will help us see if any issues occur.
```

```
*****Wake Up Print
*****
```

```
void print_wakeup_reason(){    //Set up to list reasons  
for system wake-up  
    esp_sleep_wakeup_cause_t wakeup_reason;  
  
    wakeup_reason = esp_sleep_get_wakeup_cause();     //System wakes up due to  
3 reasons  
  
    switch(wakeup_reason)  
    {  
        case ESP_SLEEP_WAKEUP_EXT0 : Serial.println("PUSHED BUTTON caused the  
system to WAKEUP"); break;  
        case ESP_SLEEP_WAKEUP_TIMER : Serial.println("TIMER caused the system to  
WAKEUP"); break;  
        default : Serial.printf("DeepSleep didn't wake up ESP32:  
%d\n",wakeup_reason); break;     //Initial Boot will yield this reason  
    }  
}  
  
    //We made the system wake up due to the internal timer and a pushed button,  
    // the reason for the push button is that in the case we can take a  
measurement at our will without having to wait for the timers.  
    //An external clock could be added to the device, however Grafana already  
designates time and date of transferred data.  
  
void setup(){  
    Serial.begin(115200);  
    delay(1000);  
  
    pinMode(32,OUTPUT);     //Illuminates a LED when the system is awake.  
For visual confirmation.  
  
    pinMode(33,INPUT_PULLUP);  
  
        //ESP32 has pull-up resistors built on the pins, when we activate it  
    //it avoids the use of external resistors  
    //INPUT_PULLUP keeps the signal HIGH by default  
    //floating currents which can produce erroneous readings are avoided by  
pull up/down resistors  
  
    for(int i=0;i<5;i++)  
    {  
        digitalWrite(32,HIGH);     // These are the parameters for the LED  
flashing  
        delay(1000);  
        digitalWrite(32,LOW);  
        delay(1000);  
    }  
}
```

```
++bootCount;
Serial.println("Reboot count number: " + String(bootCount));    */We
want to know how many times the system has booted
                                                                    */easy
way to know if there are issues internal or battery
                                                                    */issues

print_wakeup_reason();

esp_sleep_enable_ext0_wakeup(GPIO_NUM_33,0);

*/During Sleep only Pins connected to the RTC are operational
*/A General Purpose Input/output pin are used to perform digital readings
and output functions.
*/By default those pins have no predefined purpose.
*/The pin used has to be named after their GPIO

esp_sleep_enable_timer_wakeup(TIME_TO_SLEEP * uS_TO_S_FACTOR);
*/conversion factor to minutes

Serial.println("ESP32 is going into DeepSleep for " +
String(TIME_TO_SLEEP) +    */Script detailing the process
" Seconds");

Serial.println("Going to sleep now.....");
delay(1000);
Serial.flush();
*/To avoid mistakes in data transmission by
*/clearing buffer
esp_deep_sleep_start();

}
```
